How to Install The Mosquitto MQTT Broker on Windows

In this tutorial you will learn how to install the mosquitto MQTT broker (server) on Windows.

See the [installing Mosquitto on Linux](#) tutorial for how to install on a local Linux server and also a cloud server (AWS).

Download

Installing The Mosquitto Broker on Windows

Note: The term **server** instead of broker as been adopted as of [MQTT version 3.1.1](#)

There are two possibilities:

- Quick Install
- Standard Install

Quick Windows Install

The problem with the standard install is that there are certain dependencies that need to be installed before you can do the mosquitto install.

This involves installing software and copying files from other installs into the Mosquitto install folder.

You should note that from version 1.5 on support for **windows XP** was dropped, so if you need to run mosquitto on XP the you need to use an older version.

The version will also run on Windows 7, 8 and 10. It doesn't have web sockets support.

Hi - I'm Steve and this is my website on IOT technologies

and services. The Site Covers MQTT, Node-Red, Mosquitto and general computer networking

- [IOT](#)

This [tutorial](#) cover the Install on XP and includes the download files

Quick Install Mosquitto v 1.5.8

This version works with websockets.

Here is my download package and includes the SSL files for encryption .

Just unzip it go to the directory and run the broker manually as covered [here](#).

Don't forget to virus check it let me know if you have any problems with it.

Video – [How to Install Mosquitto Broker on Windows](#)

Websockets on Windows Notes

Since mosquitto 1.5.1 websockets support has been enabled on the windows binary files.

However when using 1.5.1., 1.5.2 and 1.5.3 when you start mosquitto it appears to be listening on the websocket port but doesn't allow connections.

mosquitto v 1.5.4 and above works with websockets.

Manual Install Windows

To install manually you will need to download the files from Eclipse. Here is the [link](#).

As mentioned earlier the big problem with the Windows Install is that there are lots of dependencies that you also need to install or have installed.

From version 1.5.8 the install script lets you install mosquitto **as a service**.

When Mosquitto is installed as a service it starts automatically.

However this is not important for a test environment.

First you will need to download the Windows install files from [here](#).

Windows

- [mosquitto-1.5.4-install-windows-x64.exe](#) (~360 kB) (64-bit build, Windows Vista and up, built with Visual Studio Community 2017)
- [mosquitto-1.5.4-install-windows-x32.exe](#) (~360 kB) (32-bit build, Windows Vista and up, built with Visual Studio Community 2017)

See also readme-windows.txt after installing.

Install Steps

1. Double Click on the install script

- Mosquitto
- MQTT
- MQTT-SN
- MQTT-Tools
- network programming
- Networking
 - DNS
- Node-Red
- node-red-projects
- Node.js
- Python MQTT-Projects
- Python-MQTT

Google Ads

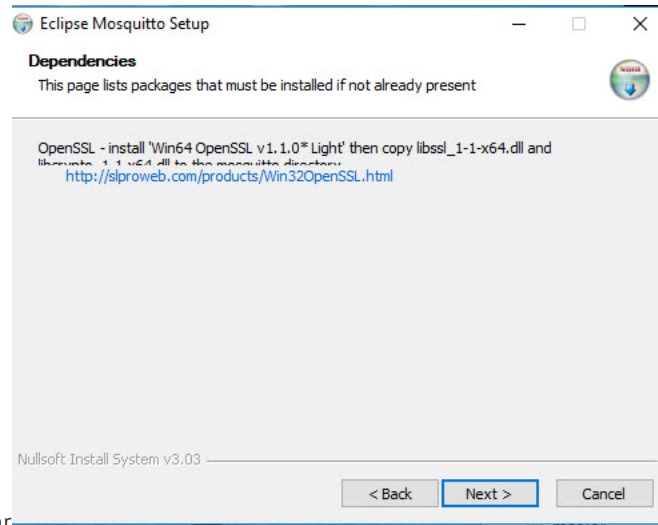

My Youtube Channel

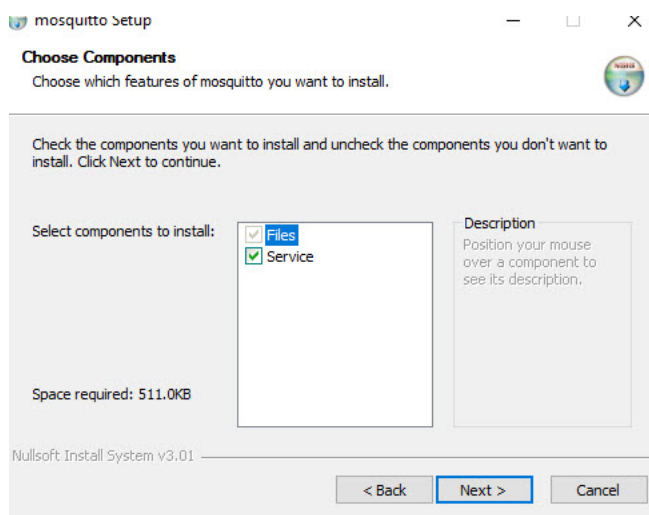

- node-red
- MQTT Brokers
- mqtt and python
- Internet

2. Note the dependencies screen which tells you what additional files are required. The

screen is not very clear

3. Select components check service to install as a service.

4. Choose a location it defaults to c:\program files\mosquitto.

5. Finish

You then need to copy the additional files to the install directory after the install again.

The additional files are

- libcrypto-1_1-x64.dll
- libssl-1_1-x64.dll

Note 1: You can obtain these files by installing openssl using the files from [here](#) or by downloading my package.

Note2: They are now included in the 1.5.8 install package.

Starting Mosquitto on Windows

To start the broker manually open a command prompt and go to the mosquitto install directory and type **mosquitto**.

```

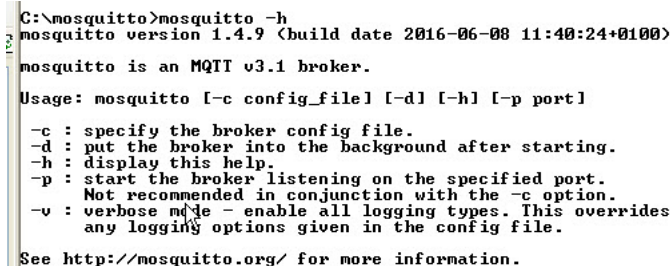

C:\mosquitto>mosquitto

```

You can also use various command line switches. Type

mosquitto -h

for help.

```

C:\mosquitto>mosquitto -h
mosquitto version 1.4.9 (build date 2016-06-08 11:40:24+0100)
mosquitto is an MQTT v3.1 broker.
Usage: mosquitto [-c config_file] [-d] [-h] [-p port]
-c : specify the broker config file.
-d : put the broker into the background after starting.
-h : display this help.
-p : start the broker listening on the specified port.
    Not recommended in conjunction with the -c option.
-v : verbose mode - enable all logging types. This overrides
    any logging options given in the config file.
See http://mosquitto.org/ for more information.

```

To start in verbose mode so that you can see console messages use the **-v** option:

```

C:\mos>mosquitto -v
1512659278: mosquitto version 1.4.9 (build date 2016-06-08 11:40:24+0100) starting
1512659278: Using default config.
1512659278: Opening ipv6 listen socket on port 1883.
1512659278: Opening ipv4 listen socket on port 1883.

```

Running Mosquitto as a Service -Update 22-12-2018 -Notes version 1.5.4 and below

On production environments you will need mosquitto to auto start on a reboot.

To start mosquitto as a service the usual use of the sc command didn't work as seen from the screen shots below.

However a reader pointed out the power shell option which does work

Here is a screen shot of my attempts using sc command

```
Microsoft Windows [Version 10.0.17134.471]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Windows\system32>sc create mosquitto binPath= "C:\mosquitto\mosquitto.exe -c C:\mosquitto\mosquitto.conf" DisplayName=
'mosquitto broker' start= auto
[SC] CreateService SUCCESS

C:\Windows\system32>sc start mosquitto
[SC] StartService FAILED 1053:

The service did not respond to the start or control request in a timely fashion.

C:\Windows\system32>sc start mosquitto
[SC] StartService FAILED 1053:

The service did not respond to the start or control request in a timely fashion.

C:\Windows\system32>setx MOSQUITTO_DIR c:\mosquitto /m
SUCCESS: Specified value was saved.

C:\Windows\system32>sc start mosquitto
[SC] StartService FAILED 1053:

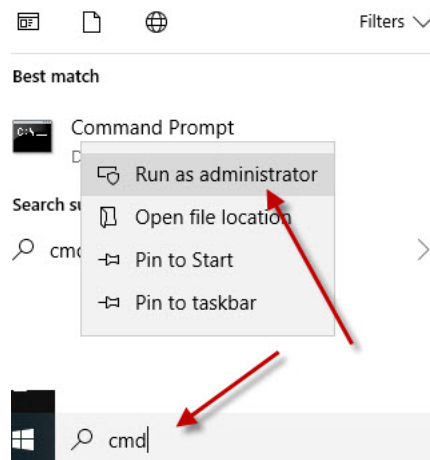

The service did not respond to the start or control request in a timely fashion.

C:\Windows\system32>sc delete mosquitto
[SC] DeleteService SUCCESS

C:\Windows\system32>sc create mosquitto binPath= "C:\mosquitto\mosquitto.exe " DisplayName= "mosquitto broker" start= aut
>
[SC] CreateService SUCCESS

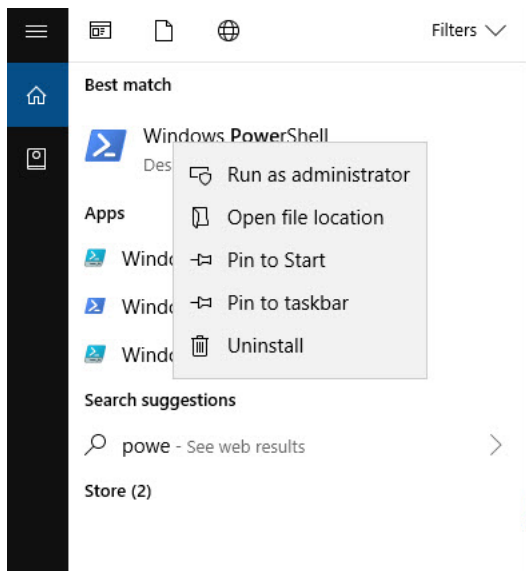

C:\Windows\system32>
```

Note you need to open the command prompt as administrator.

Installing Mosquitto as a Service using Power Shell

Open a power shell command prompt as administrator.

Change to the directory where you have installed mosquitto (mos154 below) and type:

```
./mosquitto install
```

```
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

PS C:\Windows\system32> cd \
PS C:\> cd mos154
PS C:\mos154> ./mosquitto install
```

Mosquitto is added but you don't get any confirmation and it isn't started but will start on reboot. However you can now start it manually.

Now open a normal command prompt again as administrator and type the commands:

```
sc query mosquitto
sc start mosquitto
sc query mosquitto
```

```
C:\Windows\system32>sc query mosquitto

SERVICE_NAME: mosquitto
        TYPE               : 10  WIN32_OWN_PROCESS
        STATE                : 1   STOPPED
        WIN32_EXIT_CODE       : 0   (0x0)
        SERVICE_EXIT_CODE   : 0   (0x0)
        CHECKPOINT           : 0x0
        WAIT_HINT            : 0x0

C:\Windows\system32>sc start mosquitto

SERVICE_NAME: mosquitto
        TYPE               : 10  WIN32_OWN_PROCESS
        STATE                : 2   START_PENDING
                        (NOT_STOPPABLE, NOT_PAUSABLE, IGNORES_SHUTDOWN)
        WIN32_EXIT_CODE       : 0   (0x0)
        SERVICE_EXIT_CODE   : 0   (0x0)
        CHECKPOINT           : 0x0
        WAIT_HINT            : 0x7d0
        PID                 : 1760
        FLAGS                 :

C:\Windows\system32>sc query mosquitto

SERVICE_NAME: mosquitto
        TYPE               : 10  WIN32_OWN_PROCESS
        STATE                : 4   RUNNING
                        (STOPPABLE, NOT_PAUSABLE, ACCEPTS_SHUTDOWN)
        WIN32_EXIT_CODE       : 0   (0x0)
        SERVICE_EXIT_CODE   : 0   (0x0)
        CHECKPOINT           : 0x0
        WAIT_HINT            : 0x0
```

Testing The Install

To test it is running use command:

- **netstat -a**

```
C:\Users\steve>netstat -a
```

Active Connections

Proto	Local Address	Foreign Address	State
TCP	0.0.0.0:80	ws6:0	LISTENING
TCP	0.0.0.0:135	ws6:0	LISTENING
TCP	0.0.0.0:445	ws6:0	LISTENING
TCP	0.0.0.0:554	ws6:0	LISTENING
TCP	0.0.0.0:1801	ws6:0	LISTENING
TCP	0.0.0.0:1883	ws6:0	LISTENING
TCP	0.0.0.0:2103	ws6:0	LISTENING
TCP	0.0.0.0:2105	ws6:0	LISTENING
TCP	0.0.0.0:2107	ws6:0	LISTENING
TCP	0.0.0.0:2869	ws6:0	LISTENING

You should see the Mosquitto broker running on port **1883** as shown in the screen shot above.

Another quick test is to try to start it twice in two different command prompts.

You should get an error message complaining about the port being in use.

```
C:\mos154>mosquitto -v
1546364709: mosquitto version 1.5.4 starting
1546364709: Using default config.
1546364709: Opening ipv6 listen socket on port 1883.
1546364709: Error: Only one usage of each socket address (protocol/network address/port) is normally permitted.
```

The Mosquitto.conf File

The configuration file (mosquitto.conf) that comes with the install is completely commented out, and the MQTT broker doesn't need it to start.

However when Mosquitto runs as a service it uses this configuration file. .

Don't use the commented out version and edit it as it is very long and difficult to navigate.

Instead create a blank file and add you entries to it using the commented out file as documentation.

See [Quick Guide to The Mosquitto.conf File With Examples](#)

Mosquitto Logging

If you enable logging in the **mosquitto.conf** file then when mosquitto runs it creates this file with restricted permissions, and locks the file while the broker is running.

If you stop the broker you can change the permissions on the file to access it.

See [Understanding and Configuring Logging on Mosquitto](#)

Running Multiple Mosquitto Brokers

You can configure a broker to listen on several ports, but to create multiple brokers with their own configurations then you will need to start **multiple instances** of mosquitto.

See [Quick Guide to the Mosquitto.conf file](#) and this video on [running multiple brokers](#).

Examples:

Start mosquitto and listen on port 1883

```
mosquitto -p 1883
```

Start mosquitto and listen on port 1884

```
mosquitto -p 1884
```

Start mosquitto and use the mosquitti-2.conf file.

```
mosquitto -c c:\mosquitto\mosquitto-2.conf
```

Note: starting as a daemon (-d) is not supported on windows.

Mosquitto Client Scripts

The windows install includes the client scripts.

There is a simple subscriber client

mosquitto_sub

and a publisher client

mosquitto_pub

Use

mosquitto_sub -help

They are useful for some quick tests. See [Using The Mosquitto_pub and Mosquitto_sub Client Tools- Examples](#)

Common Questions and Answers

Q- What is the difference between a quick install and a standard manual install?

A- Using my install package you don't need to install any other software as the package includes the necessary files. A standard manual install installs mosquitto as a service but a quick install doesn't.

Q- I have Mosquitto broker installed on one Windows machine can I copy it to another machine?

A- If you have already installed Mosquitto on another windows machine e.g. XP and want to install it on another machine e.g. Windows 10 then you can just copy the directory containing the mosquitto files to the new machine.

I copied my windows XP install (32 bit) onto a windows 10 (64bit) machine and a Windows 7 machine and it worked OK.

You need to be aware of the versions as windows XP doesn't support Mosquitto v 1.5 and above.

Other Tools

MQTTLens is also very useful for troubleshooting and quick testing. It is an [add-on](#) for the chrome browser.

It lets you publish and subscribe to topics using a web interface, and is much easier to use than the command line clients.

[MQTT-Ping](#) -Python Tool written by me that works like the traditional IP ping command tool.

MQTT v5 Support

Note: Starting with mosquitto version 1.6 mosquitto now supports MQTT v5.

Hi Steve,

I installed mosquitto in Windows 10 as service and it works well with the default mosquitto.conf with anonymous authentication. I want to individualize access, so I changed mosquitto.conf as you say in “Mosquitto Username and Password Authentication” and than I restarted the mosquitto service. The service do not restart and I receive the message “O servico Mosquitto Broker em Computador local foi iniciado e interrompido. Alguns servicos sao interrompidos automaticamente se nao estiverem sendo usados por outros servicos ou programas”. In English is more or less: “The Mosquitto Broker service in Local Computer was started and interrupted. Some services are automatically interrupted if they are not used by other services or programs”. There is no way to restart the service, neither rebooting. If I return the mosquitto.conf to the default (without authentication) the service restarts and mosquitto works well. I do not understand what is the problem, can you help me? Thank you

– Filippo Pardini

February 13, 2019 at 8:24 pm

Hi

You have very probably made an error when editing the conf file.

When doing testing a prefer to start mosquitto manually rather than as a service as it is quicker to test.

The error reporting whem starting mosquitto is not very clear.

[Reply](#)**Philip Knowles** says:

January 2, 2019 at 11:47 am

The sc start mosquito command needs to be an Admin Command Prompt not a "normal" Command Prompt otherwise thank you.

January 1, 2019 at 10:02 am

FYI to install version 1.5.4 as a windows service was as simple as launching powershell as an administrator and running the following:

```
c:\program files\mosquitto\ ./mosquitto install
```

[Reply](#)**steve** says:

hi steve,

i successfully installed mosquitto on my machine and verified it by checking port 1883 and it was "listening". but still when i try to run basic commands to subscribe or publish it doesnt work.

Reply

steve says:

December 12, 2018 at 4:57 pm

Start mosquitto with the -v option then you can see if the clients are trying to connect.

Steve,

I have a small Single board computer running Windows 10 Enterprise (Latte Panda module). I have been through your tutorial several times and cannot get the installer running. If I copy your files into a folder called "Moz" and then in command line run Mosquitto -V then the server does start up ok.

When I go to the Mosquitto site and download latest version of Mosquitto (32 bit), and install in the same MOZ folder, it cannot find the files in that folder and does not run. Does the version of Mosquitto matter? the downloads are different than your descriptions. Thsnk

Reply

steve says:

December 4, 2018 at 9:33 am

If the newer version doesn't run after install then I would suspect a path issue.

Have you tried going to the folder were the installer installs the files and running from there?

The only thing the installer does beside copying over the files is to configure mosquitto to start as a service which you can also do manually.

I haven't checked what files are included with the latest version but It is on my todo list but the ones in my zip package should cover everything except web sockets.

Are you going to use web sockets?

This guide was really usefull!

First time playng with MTTQ, I of course chose to follow the "hard way" to install mosquitto on Windows 10 (- LOL -)...
After some hours... I realized that the last Win32OpenSSL_Light version (v 1.1.0) doesn't

contain the two requested files (libeay32.dll ssleay32.dll), and I sorted out using the version 1.0.2n...

Then I had the VCRUNTIME140.dll issue, and this was fixed installing 'Microsoft Visual C++ 2015 Redistributable (x86)' (32bit version), as discribed in others comments.

And at last... I can turn on and off a led on my ESP-01 sending MTTC command (oops... "publishing"...) from my PC using mosquitto_pub...
Great!!!

May 24, 2017 at 3:05 pm

Hi

Did you try downloading the zip package that I put together. Unzip it and copy it to a directory and then run the broker from the command line from there. There is no need to install it.

<http://www.steves-internet-guide.com/downloads/>

[Reply](#)**Duo** says:

May 28, 2017 at 7:49 am

Hi All,

I had the VCRUNTIME140.dll issue when I install MQTT just now, and I search the issue at web, have a solution it's Visual C++ Redistributable for Visual Studio 2015 installed, I just download the file and installed, and re-install mosquitto, the problem has been solved, hope the information can help you.

[Reply](#)**Jonez** says:

December 29, 2017 at 9:40 am

Note that you need to install 32-bit version of it. I had 64-bit version (x64) but it is not compatible with this and the symptom was that I could not start mosquitto and the

error message was 'The application was unable to start correctly (0xc000007b)'
After installing 'Microsoft Visual C++ 2015 Redistributable (x86)' it started.

Hi steves

I followed you and it works correctly.

But when I stopped mosquitto as below, publish and subscribe work again!!!why?

code :

```
pc@ubuntu:~$ sudo /etc/init.d/mosquitto stop
```

```
[ ok ] Stopping mosquitto (via systemctl): mosquitto.service.
```

```
pc@ubuntu:~$ mosquitto_pub -d -t /topic1 -m myMessage
```

```
Client mosqpub/7237-ubuntu sending CONNECT
```

```
Client mosqpub/7237-ubuntu received CONNACK
```

Client mosqpub/7237-ubuntu sending PUBLISH (d0, q0, r0, m1, '/topic1', ... (2 bytes))

Client mosqpub/7237-ubuntu sending DISCONNECT

mosquitto_sub -d -t /topic1

Client mosqsub/7104-ubuntu sending CONNECT

Client mosqsub/7104-ubuntu received CONNACK

Client mosqsub/7104-ubuntu sending SUBSCRIBE (Mid: 1, Topic: /topic1, QoS: 0)

Client mosqsub/7104-ubuntu received SUBACK

Subscribed (mid: 1): 0

Client mosqsub/7104-ubuntu received PUBLISH (d0, q0, r0, m0, '/topic1', ... (2 bytes))

myMessage

why???

Reply

steve says:

May 10, 2017 at 7:53 am

It doesn't look like it is being stopped or it may be automatically restarting. Ubuntu installs don't use the init scripts.

Try using the **sudo service mosquitto stop** command.

You can check using **netstat -at** command
